

### Seminar

#### Viewing Rotation of Majorana Qubit on Bloch Sphere by Microwave Radiation due to Josephson Effects

**Xiao Hu**

*International Center for Materials Nanoarchitectonics (WPI-MANA),  
National Institute for Materials Science, Tsukuba, Japan*

**Time: 4:00pm, Oct. 18, 2016 (Tuesday)**

**时间: 2016年10月18日 (周二) 下午4:00**

**Venue: Room w563, Physics Building, Peking University**

**地点: 北京大学物理楼, 西563会议室**

#### Abstract

We propose a new way for manipulating Majorana qubits in nanowire topological superconductors [1]. The prototype setup consists of two one-dimensional topological superconductors coupled by a quantum tunneling junction [2]. We show theoretically that injecting current into the system induces a Landau-Zener-Stuckelberg interference between the parity states of Majorana qubit. Adjusting the current pulse and the gate voltage at junction, one can build a Landau-Zener-Stuckelberg interferometry as a universal gate for the Majorana qubit. The rotation of Majorana qubit on Bloch sphere can be monitored by analyzing spectra of microwaves radiated from the system, which includes a novel spectrum peak induced by the fractional Josephson effect associated with Majorana quasiparticles, in addition to that due to conventional Josephson effect of Cooper pairs. Our work is expected to enhance the exploration of Majorana physics [3,4] and eventually the implementation of topological quantum computation.
